

YieldPay

Protocol POC Requirements

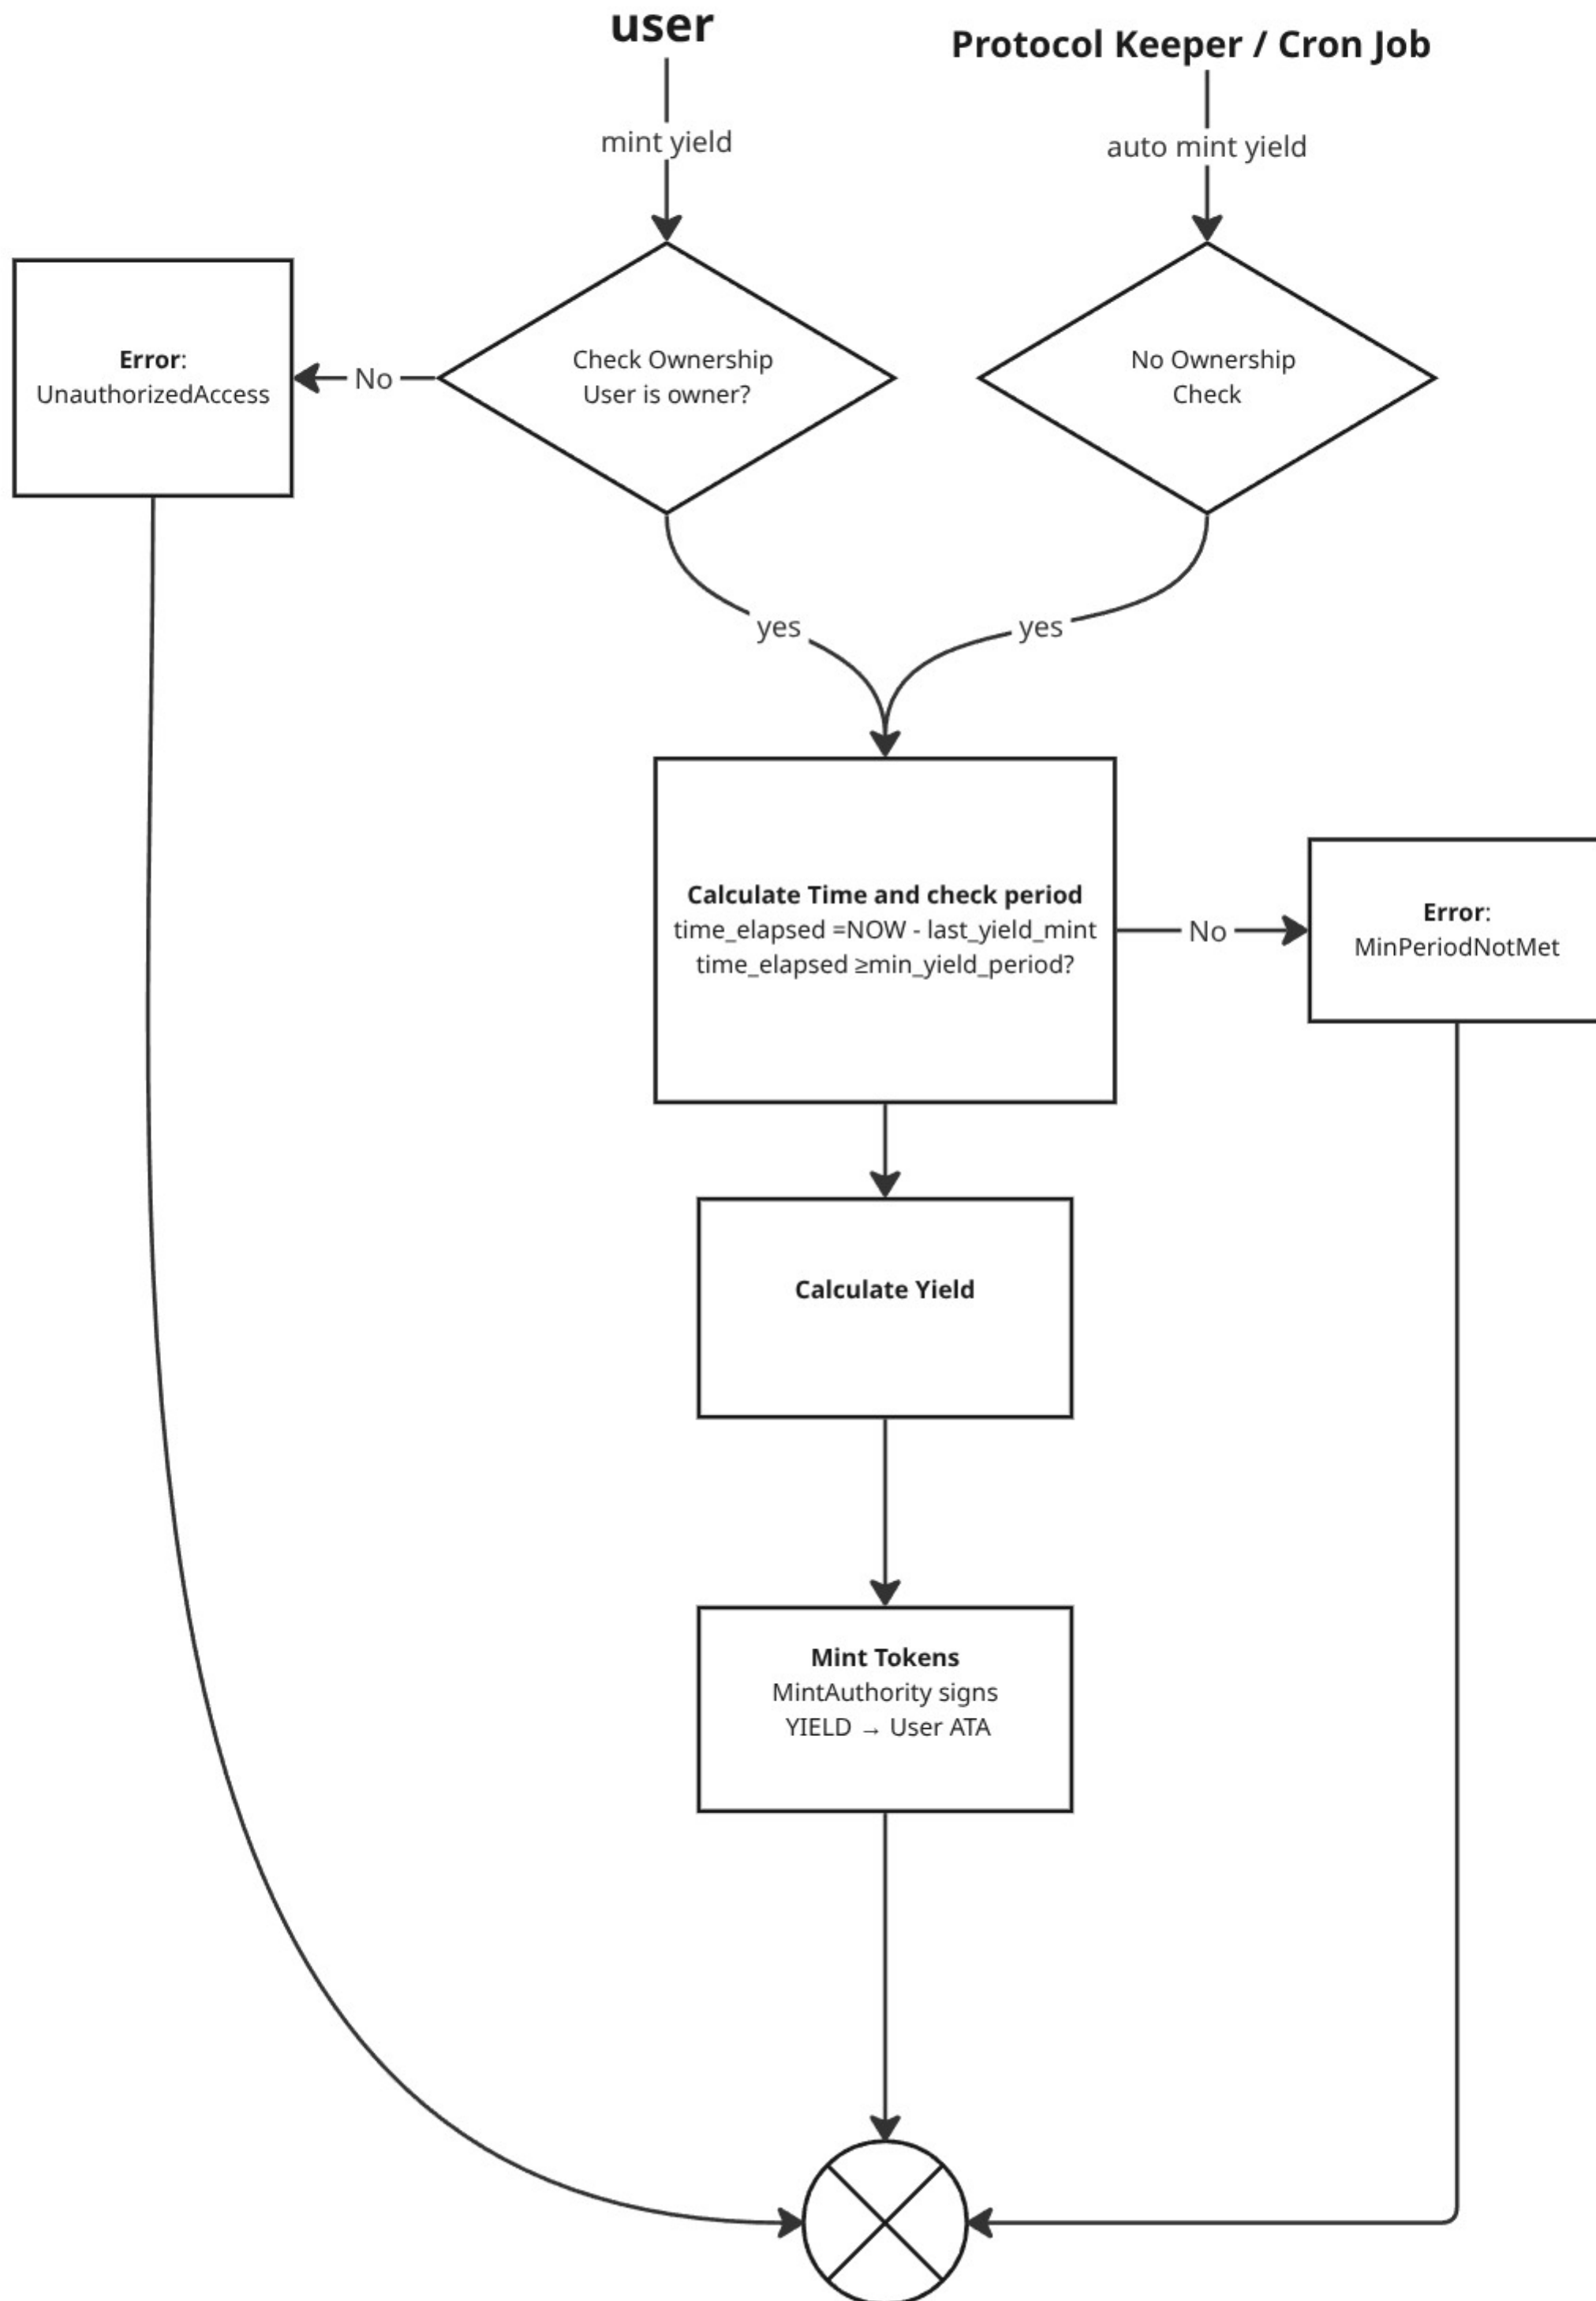

- The protocol allows users to **deposit and stake** USDC/USDT tokens from a whitelisted token list.
- Upon staking, a **UserStakingAccount** and **UserYieldAccount** are created to track deposits and yield.
- The protocol enforces **minimum deposit** and **maximum stake limits** per user.
- All deposited tokens are securely transferred to a **vault account** controlled by a PDA.
- The system calculates **yield based on a configurable APY rate** and allows users to **claim accumulated yield** in YIELD tokens.
- Merchants can **register** with a verified business name to receive payments in YIELD tokens.
- Users can **pay merchants** directly using their earned YIELD tokens, without touching their principal stake.
- The protocol keeps **user principal locked** while allowing spending of yield.
- All payments are validated, ensuring **merchant registration and user balance sufficiency**.
- The protocol **tracks total yield earned** by users and **total yield received** by merchants.
- Users can **withdraw their staked tokens** anytime after claiming pending yield.
- Upon full withdrawal, the system inactivates **the UserStakingAccount**.
- The user can close the **userStakingAccount** after a full unstake.
- Merchants can **deregister** or close their **MerchantAccount** after withdrawing remaining balances.
- All account operations are validated with **ownership checks** and **secure PDA-based signatures**.
- Clear error messages are returned for failed transactions.

DEPOSIT TOKENS FLOW

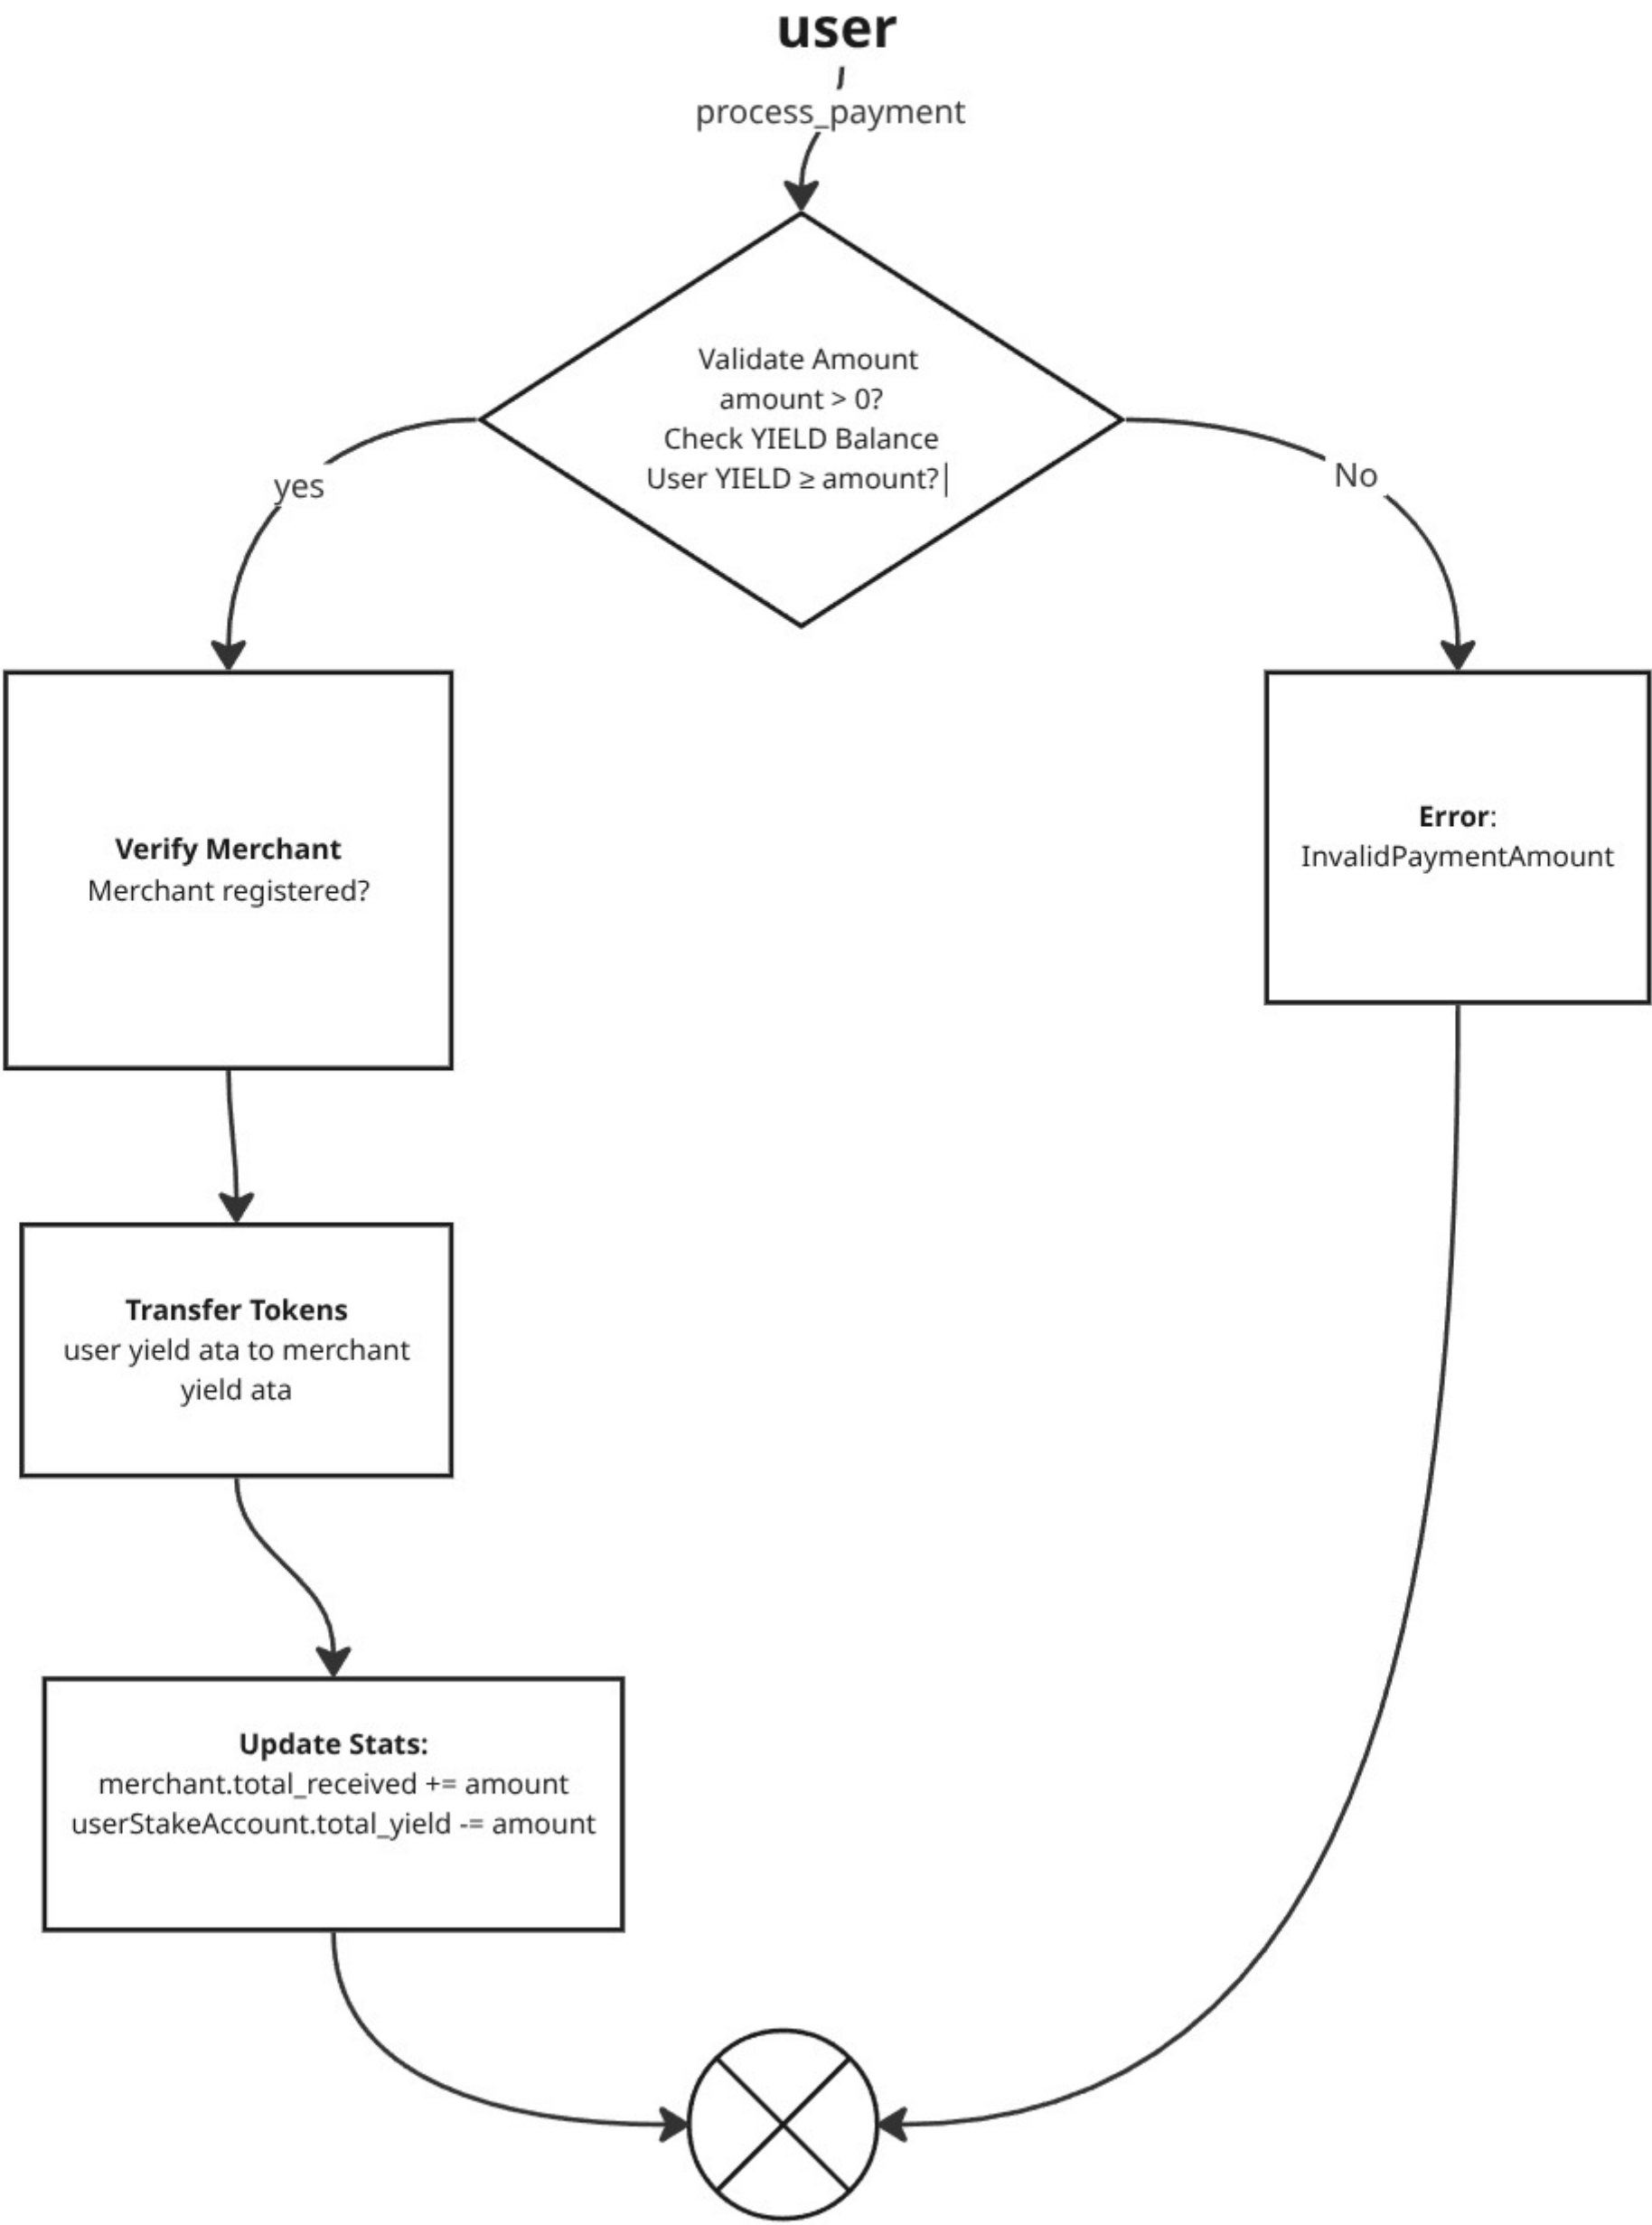

MINT YIELD (CLAIM YIELD)

METHOD 1: User manually claims yield
METHOD 2: Auto-minted by protocol/keeper
Must wait minimum period
YIELD tokens minted to user

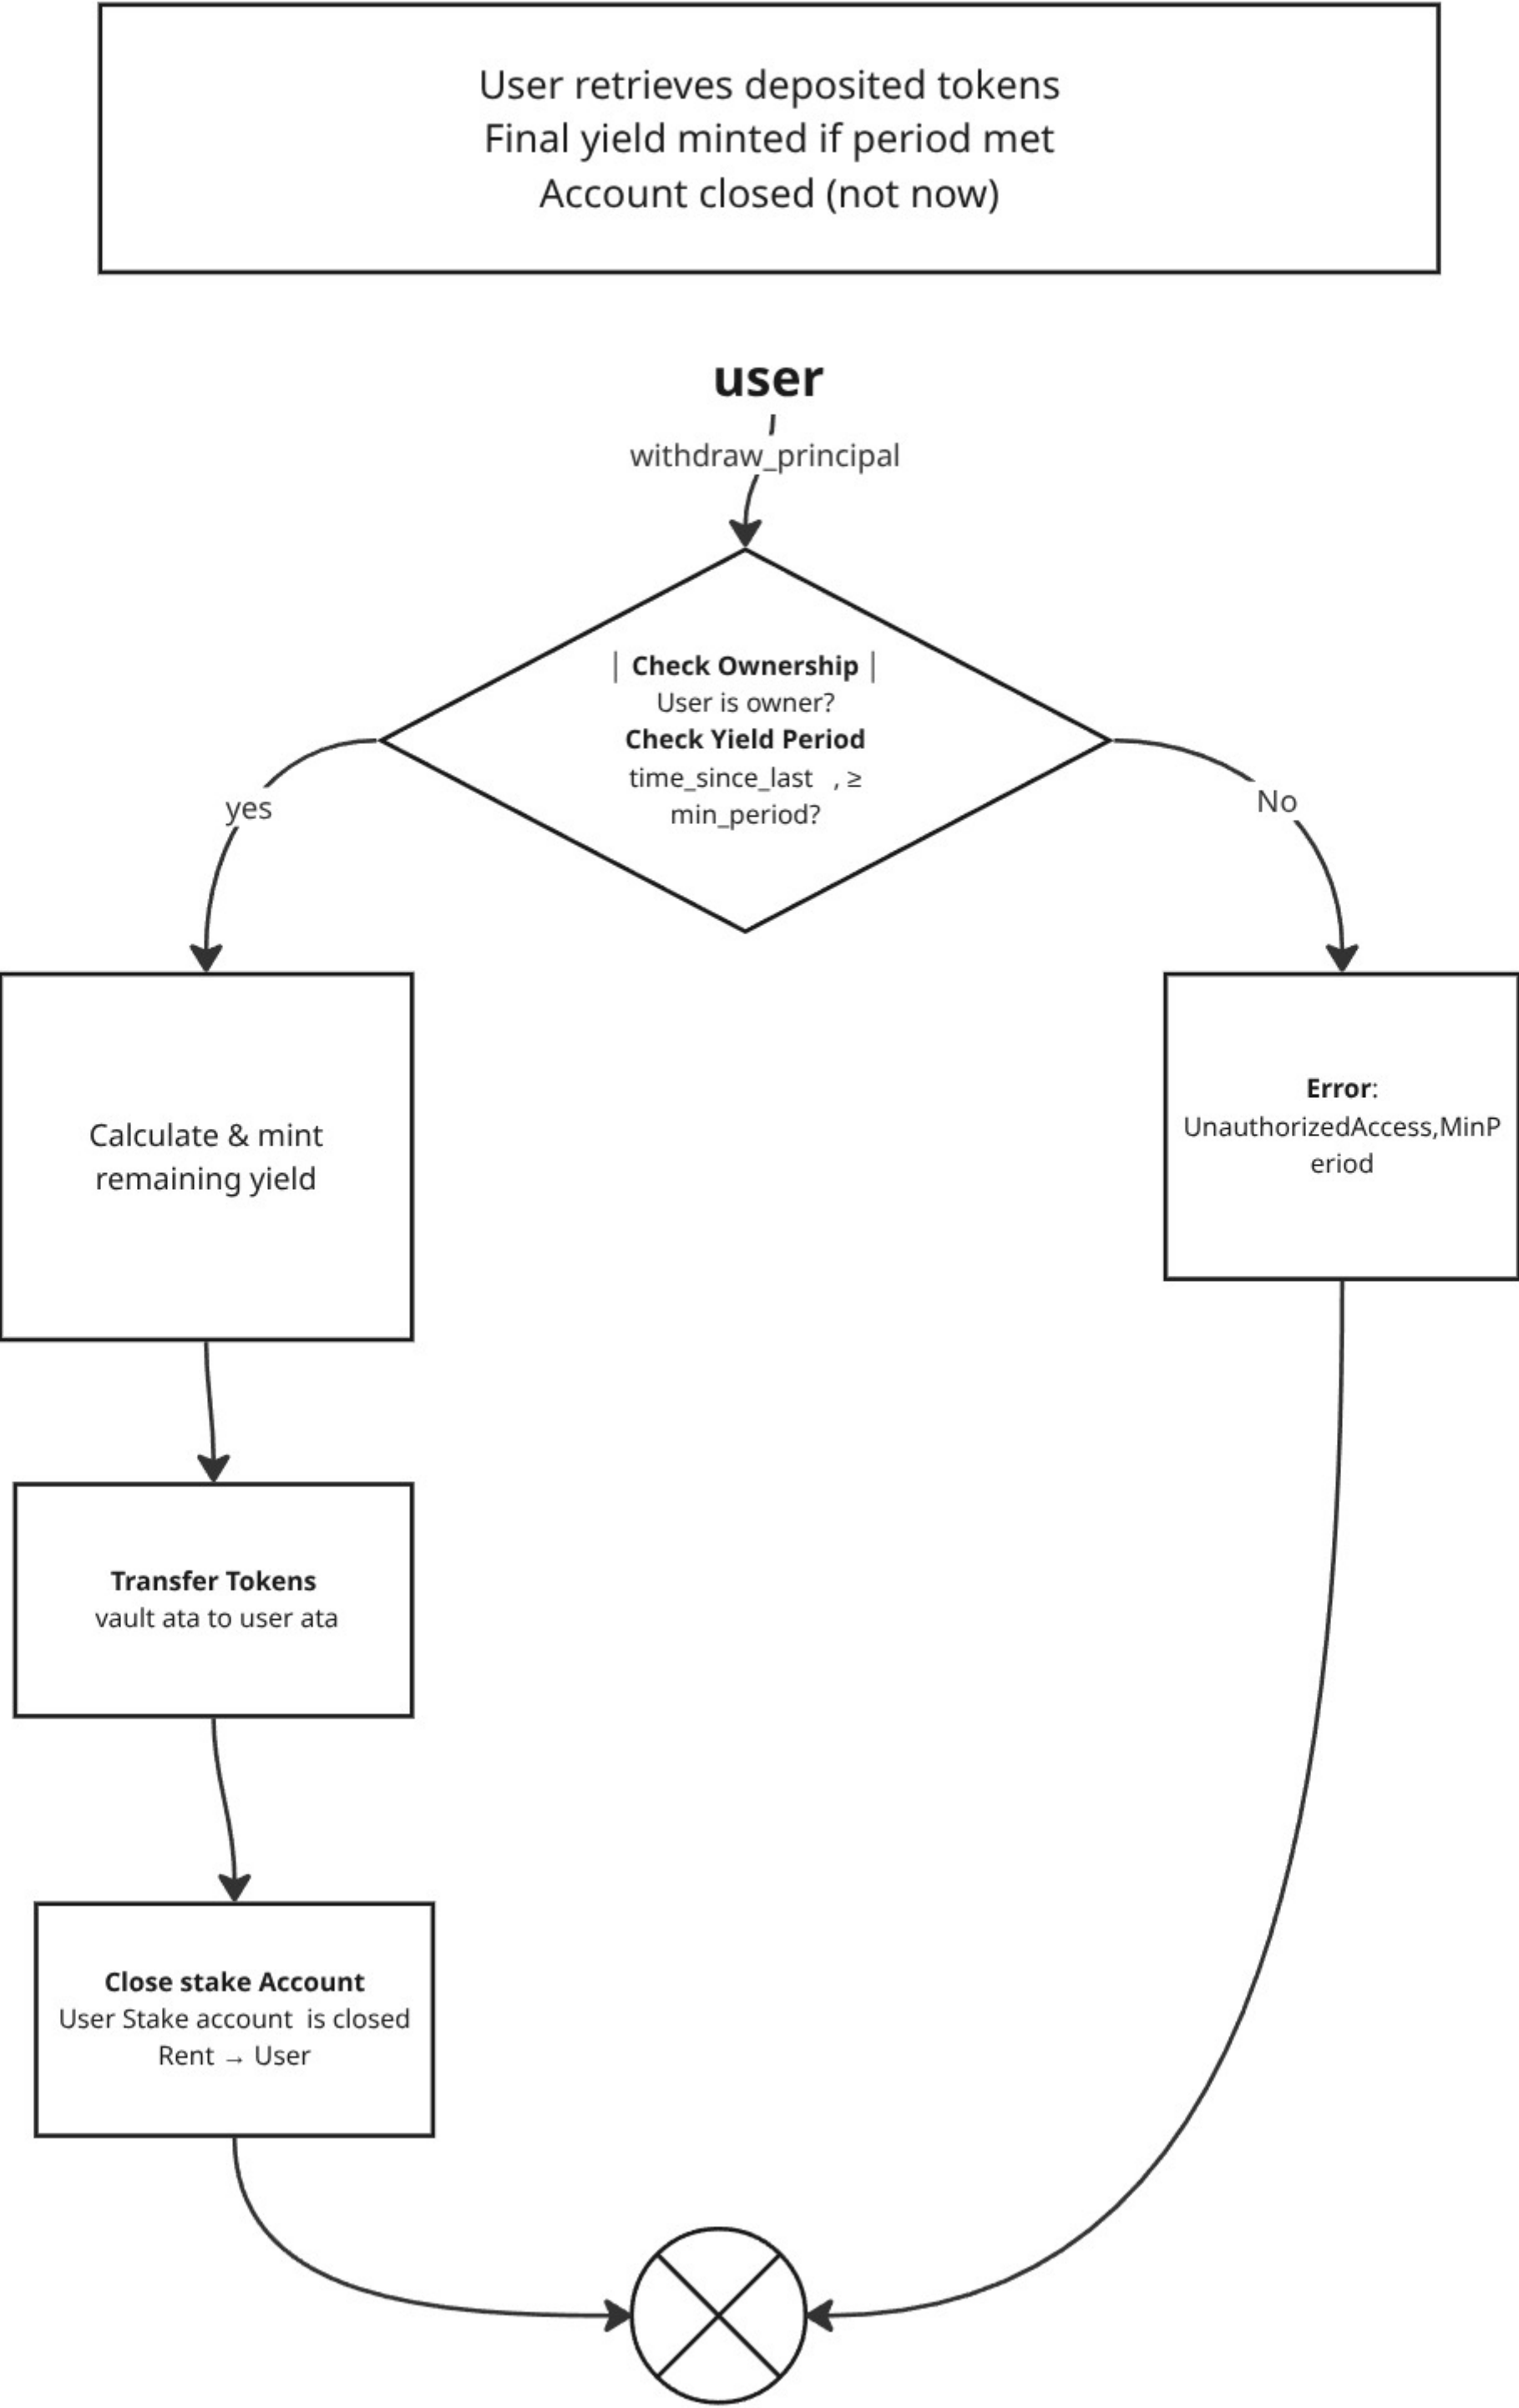

PAY MERCHANT

User transfers YIELD tokens to merchant
Principal remains locked
Merchant receives payment

WITHDRAW PRINCIPAL (UNSTAKE)

high-level Overview
